# Small RNAs of Horticultural Crops and their Functional Implications

(<sup>\*</sup>Rajesh S<sup>1</sup>, Radhamani T<sup>1</sup>, Ramesh SV<sup>2</sup> and Srimathipriya L<sup>3</sup>) <sup>1</sup>Centre for Plant Molecular Biology and Biotechnology, Tamil Nadu Agricultural University, Coimbatore 641003, Tamil Nadu, India <sup>2</sup>ICAR- Central Plantation Crop Research Institute, Kasaragod-671124, Kerala, India <sup>3</sup>TNAU- Horticultural College and Research Institute, Periyakulam-625604, Theni District, Tamil Nadu, India <sup>\*</sup>Corresponding Author's email: rajesh.s@tnau.ac.in

Plant small non-coding RNAs (ncRNAs) constitute an key player in gene regulation as an effector molecule of several biological aspects such as growth, development, metabolism, response to environmental stressors, maintenance of genome integrity etc. The three main small RNA players of importance are microRNAs (miRNAs), small interfering RNA (siRNAs) and phased siRNAs (phasiRNAs) (Yu et al., 2019). The diverse yet vital roles of plant small RNAs, especially miRNAs, in various developmental processes such as growth, stress response, temporal transitions, etc are delineated.

The repertoire of small RNAs in horticultural crops and its role in developmental functions and the mechanistic roles they orchestrate is discussed. Originally, the focus of research on small RNAs were in Arabidopsis, a model crop and later shifted to field and horticultural crops. Unraveling of genome sequences of many horticultural crops have greatly aided in this process of characterization of miRNAs. However, with the major jump in success of latest DNA sequencing technologies, the diversity and functional roles, including gene regulatory functions played by this small RNAs of horticultural crops have received a major focus (Fig. 1).

Fig. 1. Role of small RNAs in various developmental stages of horticultural crops (Adapted from Wang et al., 2020)

# Small RNAs characterized in horticultural crops

Small RNAs have been characterized in horticultural crops like flower crops (Chrysanthemum); vegetables (tomato, *Brassica rapa* L. ssp. *Pekinensis*), fruits crops such as

### Rajesh et al. (2025)

apple, banana, citrus, pear, persimmon etc.. Analysis of miRNAs (micro RNAs) of diverse plant species suggests that conserved miRNAs such as miR156, miR162, miR164, miR166, and miR172 are found in horticultural species apple, kiwi fruit and pear (Guo et al., 2020). However, some miRNAs are specific to group of plants eg. miR528 which is a core regulator of reactive oxygen species (ROS) homeostasis is found in monocots.

On the other hand, PHAS-derived phasiRNAs, and tasiRNAs (TAS1 and TAS2) derived due to the activity of miR173 are specific to *Arabidopsis*. Similarly, miR390 and miR828 are known to cleave TAS3 and TAS4, respectively to yield ARF-tasiRNAs, which is involved in flower and fruit development and MYB-tasiRNAs controlling the secondary metabolite synthetic pathway namely phenylpropanoid pathway with profound implications for novel horticultural and consumer traits such as flavor, pigmentation, and texture. In citrus a species-specific miR3954 is involved in the generation of phasiRNAs that has serious implications for flowering time (Liu et al., 2017). Functional role of the miRNAs in horticultural crops is briefed in Table 1.

| Crop                                     | miRNA  | transcripts   | <b>Developmental role(s)</b>  |

## Conclusion

The widespread occurrence of sRNAs in most developmental processes of food crop growth indicates their role as crucial regulators of agricultural traits. Small RNAs are involved in suppression of target gene expression and also in regulating complex gene regulatory mechanisms. Small RNAs broadens their biological significance and offer novel tools for modifying agriculturally important traits.
